

A GROK BOT CREW FOR SOLANA

What you can use in REAGENT today

REAGENT is a Grok Bot crew that reads tokens straight from the chain and hands back one sheet where every line names the call it came from. These are the parts that are live right now.

Research desk	reagents.tech	Bubble map	on every sheet
New tokens tape	top of the desk	REAGENT Watch bot	Telegram
MCP for AI agents	one link	Open source	GitHub

Research desk

reagents.tech

Paste a token address and send in the crew. You get back a full sheet on that token.

- **Networks:** Solana, plus Ethereum, Base, BNB Chain, Arbitrum, Polygon and Robinhood Chain.
- **Twelve contract readings**, each with the call it came from.
- **Market and holders:** the deepest pool and its liquidity, 24h volume, holder count, top 10 share and the largest holder.
- **Provider checks** from RugCheck or GoPlus, named on the sheet.
- **Grade A–F** with its working shown: every factor, what it scored and why. When a reading can't be taken, the sheet says so and gives the reason.
- **Crew notes:** a short note from each agent on what the evidence shows.

Authority
DMdBa812dBW1CHVhmTyUyVcrBnSbZbfoFC7U14k4riH1 can assign a transfer hook program, while 66.41% of sampled supply is locked.

Pump is a Token-2022 token on Solana with a fixed supply and disabled freeze authority. An authority retains the right to set an executable transfer hook on transfers. In the 100-holder sample, 66.41% of supply is held in lock contracts and program vaults.

MAIN CATCH
The primary structural exposure is that an authority can introduce an active program to

LIQUIDITY & EXITS

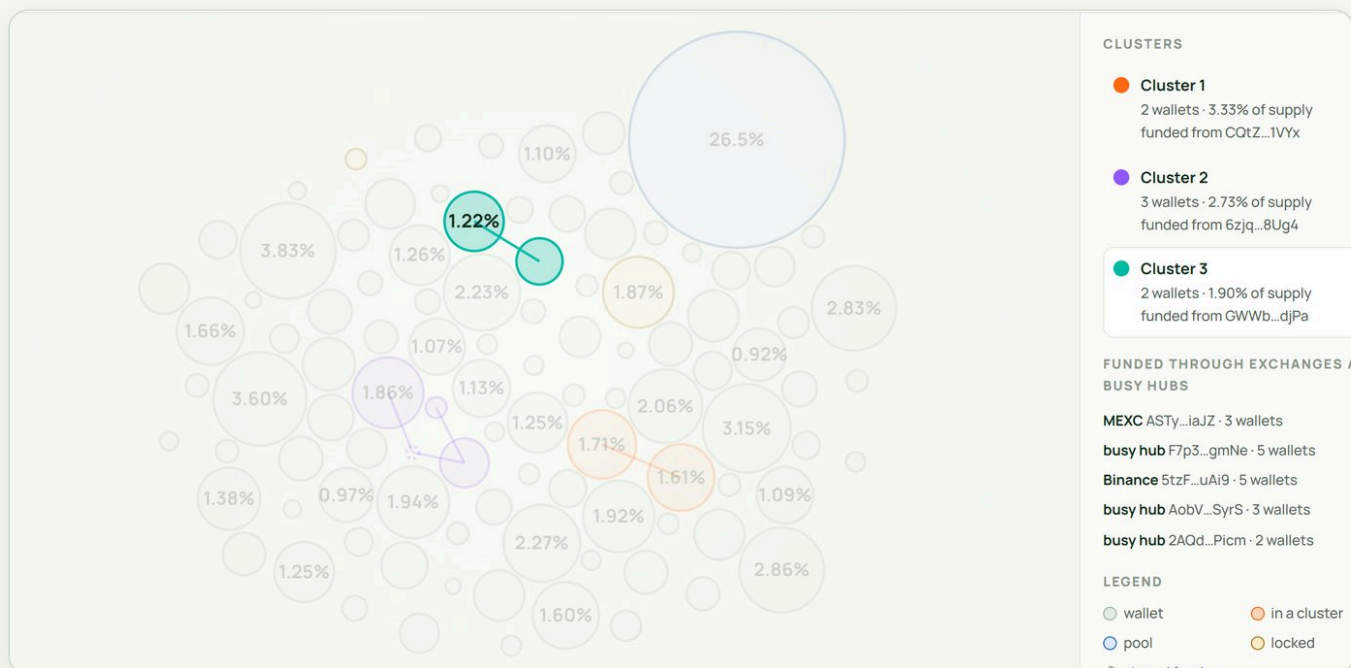

A live sheet for \$PUMP: the grade with each factor's score, then a note from each agent.

Bubble map

on every sheet

A token's holder wallets, sized by their share of supply.

- Wallets funded by the same address are grouped into clusters, with the share of supply each cluster holds.
- Exchanges and busy hubs are listed apart, so a shared Binance withdrawal doesn't join strangers into one cluster.
- Pools, burn addresses and lockers are marked as such.
- Click a bubble to see the wallet, its share and who first funded it.

New tokens tape

top of the desk

New Solana tokens run across the top of the desk as they launch. Only the tokens that pass the filters make the list.

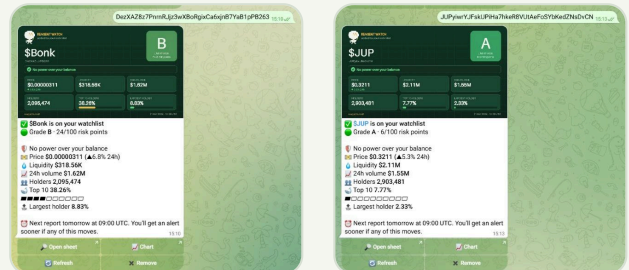

- Each card shows a quick grade, age, market cap, 1h change and how many tokens its dev launched before.
- **Scan** sends the crew to that token on the spot. **pump.fun** opens its coin page.

REAGENT Watch bot

t.me/reagentss_bot

Put the Solana tokens you hold under watch in Telegram. Send the bot a token address, or tap the button on any sheet.

- **Card for every token:** grade, live powers, price, liquidity, volume, holders, top 10 and the largest holder.
- **Reports** on the tokens you watch.
- **Alerts** the hour something moves: a new power over your balance, liquidity draining, holders concentrating, the grade changing.
- **Free** for one token. \$REAGENT holders watch up to 50, by tier.

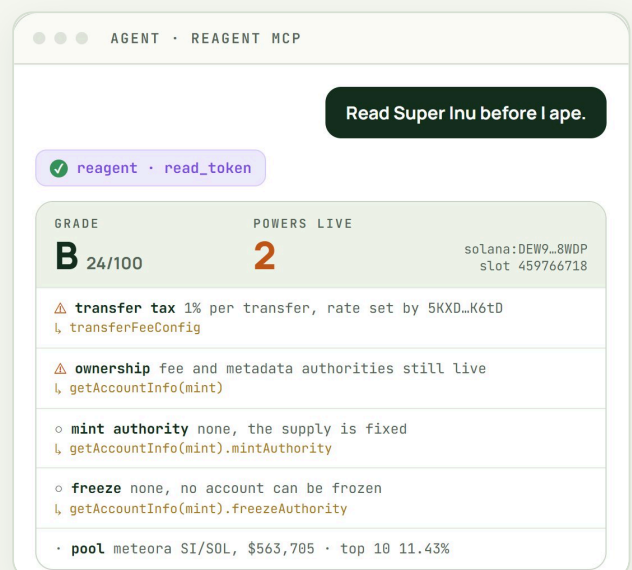

MCP for AI agents

reagents.tech/mcp

Give Claude, Cursor or your own trading bot a contract reader. It connects with one link, nothing to install.

```
claude mcp add --transport http reagent https://www.reagents.tech/api/mcp
```

- **read_token** : the grade, live powers, pool and holders, with the call each reading came from.
- **holder_clusters** : holder wallets grouped by who funded them.
- Claude Desktop and claude.ai: Settings → Connectors → Add custom connector, and paste the same link.
